Insurance Claims Analysis – Coding Challenge (Using Lists)

You are a **Data Analyst** working for an insurance company. You received raw claim data stored in lists.

Dataset (Lists)

policy_ids = [101, 102, 103, 104, 105, 106]

claim_amounts = [5000, 15000, 7000, 20000, 3000, 12000]

claim_status = ["Approved", "Rejected", "Approved", "Approved", "Rejected", "Approved"]

customer_age = [25, 45, 35, 50, 23, 40]

Tasks

Task 1: Total Approved Claim Amount

Calculate the **total claim amount** for all *Approved* claims.

Task 2: Count Rejected Claims

Find how many claims are **Rejected**.

Task 3: High-Value Claims

Print all **policy IDs** where claim amount is greater than **₹10,000**.

Task 4: Average Age of Approved Customers

Find the **average age** of customers whose claims are *Approved*.

Task 5: Risk Category Tagging

Create a new list called risk_category:

- Age < 30 → "Low Risk"
- Age 30–45 → "Medium Risk"
- Age > 45 → "High Risk"
