Coding Challenge: Ride Booking Data Analysis (Using Tuples)

Scenario

You are working as a **data analyst** for a ride-booking company (like Ola/Uber).
You received trip data stored as **tuples**.

Each tuple contains:
(Trip_ID, City, Distance_km, Fare_amount)

Sample Data

```
trips = (

(101, "Bangalore", 12.5, 250),

(102, "Hyderabad", 8.0, 180),

(103, "Bangalore", 15.2, 300),

(104, "Chennai", 5.5, 120),

(105, "Bangalore", 7.8, 200)
)
```

- **Task 1: Total Trips**

Find the **total number of trips**.

- **Task 2: Trips from Bangalore**

Count how many trips happened in **"Bangalore"**.

- **Task 3: Total Revenue**

Calculate the **total fare amount** collected from all trips.

- **Task 4: High Distance Trips**

Print all trips where **distance > 10 km**.

- **Task 5: Highest Fare Trip**

Find the trip with the **maximum fare**.

- **Task 6 (Bonus - Real Analyst Thinking**

Find the **average fare for Bangalore trips only**.
