Coding Challenge: Ride Booking Analysis

You are working as a data analyst for a ride-booking company like Ola/Uber.

Each ride record is stored as a **tuple**:

(ride_id, driver_name, city, fare, rating)

Sample Data:

```
rides = (
    (101, "Ravi", "Bangalore", 250, 4.5),
    (102, "Anjali", "Hyderabad", 180, 4.2),
    (103, "Kiran", "Bangalore", 300, 4.8),
    (104, "Meena", "Chennai", 220, 4.0),
    (105, "Arjun", "Bangalore", 150, 3.9)
)
```

Tasks

Count total rides

👉 Find how many ride records are present.

Extract all rides from Bangalore

👉 Print only tuples where city = "Bangalore"

Find total revenue from Bangalore

👉 Sum of fares where city is Bangalore

Find highest rated driver

👉 Print the tuple with maximum rating

Average rating per city

👉 Output should look like:

```
{
  "Bangalore": 4.4,
  "Hyderabad": 4.2,
  "Chennai": 4.0
}
```
